

# ASHIDA Numerical Single Pole OC/EF Protection Relay

Type: ADR111C  
ADR211C  
(ADITYA Series)  
(Preliminary)

#### Protection Features:

- ✓ Suitable for Single Pole Phase Over Current Relay with IDMT/DMT.
- ✓ Suitable for Single Pole Earth Fault Relay with IDMT/DMT.
- ✓ Restricted Earth Fault Relay (REF) relay
- ✓ Selection of Curve: Five selectable curve (Normal Inverse 1 (C1), Normal Inverse 2, (C2) Very Inverse (C3), Extremely Inverse (C4), Long Time Inverse (C5)) and Define Time (C6).
- ✓ Instantaneous Over-Current Protection with adjustable timer.
- ✓ Breaker Failure detection.
- ✓ In-built CB Trip Circuit Supervision function during pre closing and post closing of CB.
- ✓ On site CT Secondary selection 1A or 5A.
- ✓ **Wide range Power supply input 24V to 230V AC/DC(±20%)**

- ✓ RS422/RS485 (at rear) Communication Port for remote SCADA (only for ADR211C i.e. communicable Relay).

#### Relay Design Features:

- ✓ 16 x 2 LCD Backlit display for Parameter and setting display.
- ✓ Online display of CB status and other digital and logical status.
- ✓ Continuous monitoring of module's internal hardware and alarm generation in case of failure of any critical components.
- ✓ 4 Digital Output contacts for local alarm as Trip.
- ✓ 2 dedicated status input for Trip Circuit Monitoring.
- ✓ 5 nos of Fault data stored with keypad interface and time stamping.

#### Description:

ADR111C is second generation Numerical Single Pole Over Current Relay. It consist all the

Type: ADR111C  
ADR211C  
(ADITYA Series)  
(Preliminary)

necessary protection and monitoring functions required for normal Feeder. It consist of

1. High Speed Digital DSP Controller.
2. Analogue Measuring Module.
3. Power supply Module.
4. Digital Input / output module.

The High speed Digital Signal Controller continuously monitors current along with different optical isolated status connections. The high-speed micro-controller samples these current signals through an **A/D converter**. The Digital Signal performs powerful **Numerical Algorithms** to find out RMS of fundamental & harmonic contents of the current then this value is used for protection and metering function. **All measurement is tuned to fundamental frequency i.e. 50Hz, thus relay remains stable during distorted waveform generated by electronics loco-motive.** All these measured values are then used for different protection function such as IDMT/DMT Over Current Protection, Instantaneous Over Current Protection, Earth Fault Protection, etc. These measured values are also displayed on large 16 x 2 LCD display for metering purpose. The **DSC** also monitors different digital inputs through optical isolator and performs some monitoring function such Trip Circuit Supervision, and control potential free contact for control CB and generate ALARM and Tele-signalling.

The power supply module is basically DC – DC converted designed using modern PWM based Switching mode technique to convert station battery supply to the 12V and 24Vdc low voltage supply for relay electronics and control circuit. It also provides necessary isolation from station battery. The power supply module is

design using very advance PWM controller which allow very wide input supply variation i.e. 24V to 230V AC/DC ( $\pm 20\%$ ) covering 24Vdc, 30Vdc, and 110Vdc and 220Vdc station battery requirement.

The relay is having total 4 nos of high intensity dual LED for easy identification of type of fault for easy user interface. All LEDs and control output R1 to R4 are fully programmable via keypad interface

### Main Functions

The ADR111C are having following protection functions.

1. Non Directional Phase Over Current element. ( $I>$ , and  $I>>$  ) can be used as OC/EF protection
2. Inrush Detection
3. Trip Circuit Supervision.
4. Breaker Failure Detection.
5. Monitoring Functions.

Each of these functions are independently programmable and can be enabled or disabled by user depending upon requirement.

### Over Current / EF Element:

The ADR111C is member of Ashida Numerical Relay family designed for protection of general Feeder. The relay has one stage of IDMT/DMT setting and one stage of instantaneous setting. ( $I>$ ,  $I>>$ ). All major international IDMT curves are available. Range for first stage is 5% to 200% for  $I>$  and 10% to 2000% for instantaneous stage. Although the curves tend towards infinite when the current approaches  $I_s$  (general threshold), the minimum guaranteed value of the operating current for all the curves

with the inverse time characteristic is 1.1Is (with a tolerance of ± 0.05Is).

### Inverse Time Curves:-

The each stage thresholds for phase (earth) over current can be selected with an Inverse Definite Minimum Time (IDMT) characteristic. The time delay is calculated with a mathematical formula. The time delay can be reduce by Time Multiplier Setting (TMS) as shown in fig.

$$t = \frac{K \cdot a}{\left[ \frac{I}{I_{ref}} \right]^b - 1}$$

Curve Type	Description	a	b
C1	Standard Inverse_1	0.14	0.02
C2	Standard Inverse_2	0.06	0.02
C3	Very Inverse	13.5	1
C4	Extremely inverse	80	2
C5	Long Time Inverse	120	1
C6	Define Time	-	-

Page 3 / 11

### **Inrush Detection:**

During switching of load there is sudden surge of magnetising inrush current. The ordinary protection may sense this current as fault current and give wrong tripping. Normal practice is to increase time or current setting so that it will not operate during switching ON. But this will desensitize the protection. To avoid this ADR111C relay is having special feature to detect this magnetising current by measuring harmonics of current wave form and restrain tripping operation.

### **Trip Circuit Supervision:-**

The ADR111C is having 2 dedicated digital Opto-isolated status inputs which can be used to continuously monitor continuity of trip-circuit. The general scheme is as shown in figure.

Fig. Trip Circuit Logic

The Relay monitors Trip coil continuity through CB NO during close condition and through CB NC during Trip condition. If any discontinuity is observed it generates Alarm signal.

The output can be assigned to any of 4 relays RL1 to RL4, The Trip circuit supervision logic set Reset PROTH (Protection healthy) bit, it is normally ON and become OFF at following condition

- ✓ When DC supply is not sufficient (DC Fail).

- ✓ When CB NO and CB NC both active and both inactive. CB NO as well as CB NC is close or open.
- ✓ Relay detects any internal hardware Error.

### **Breaker Failure Detection:-**

Normally after tripping, current should become Zero within 100 – 200ms time depending upon type of fault and breaker mechanism. After Fault ADR111C triggers internal timer (settable from 50ms to 800ms) if fault is not cleared during this time then relay declares as Breaker Fail (LBB function) and set BF bit. This bit can be assigned to any of the output relay.

### **Programmable DI/DO and LED:-**

The ADR111C has 4 digital outputs, 2 Opto-isolated input and 4 general purpose LEDs. These can be programmed by local key board. Any logical or physical status can be assigned to any relay contact. The logic of digital status input as well as logical status can be formed and assigned to any of the relay output. The RL1 relay is by default assigned to tripping CB.

### **Monitoring Functions (Event Record) :**

Apart from the basic protection functions, Relay continuously monitors all substation operations through status, its internal functions, internal hardware etc. if any change is observed it is marked as event. Such types of events are stored in internal non-volatile memory along with time stamped. Following are some of the events. Relay PKP, Relay Reset, CB Trip, CB close, change of any digital status input, Relay setting changed etc.

Up to 100 such event can be stored and can be downloaded for detailed analysis.

(ADITYA Series)  
(Preliminary)

## Relay Talk Software:

The general communication software is provided to communicate with relay, known as Relay Talk. By using this software data such as event log, setting, Fault history etc can be down loaded and can be used for further analysis.

## Technical Specifications:

General specifications			
Sr. No.	Specification	Particulars	
I.	Current Input	: Suitable for CT secondary 1A/ 5A site selectable	
II.	Aux. Supply	: 24 – 230VDC. ( $\pm 20\%$ )	
III.	VA burden on CT	: Less than 0.2VA	
IV.	VA burden on Aux.	: Less than 10 Watts	
V.	Operating Temp. range	: -10 deg. to + 65 deg.	
VI.	Continuous carrying capacity	: 2 x of rated for CT	
VII.	Pick up	: Within 1.1 times of set value.	
VIII.	Reset Value	: 95% to 90% of pick up.	
IX.	Output Contact	: 4 Trip duty user assignable	
X.	Contact Rating	: Continuous: 5A : Make & carry for 0.5 sec : 30A : Make carry for 3 sec : 15A	
XI.	Opto Isolated input	: 1 for CB NO & 1 for CB NC	
XII.	Thermal With stand for CT	: 20 x of rated for 3.0 sec.	
General Settings			
XIII.	<b>General setting</b>	: New PassWord	0 – 99 in steps of 1
		: Unit Id	0 – 250 in steps of 1
		: CT Sec	1A or 5A
		: CT Primary	10 – 2000 in steps of 10
		: Test Block	01: YES, 02: NO
		: Trip Ckt.	01: YES, 02: NO
		: BF Enable	01: YES, 02: NO
		: BF Delay	50-800 ms in steps of 50ms
		: Inrush Det	01: YES, 02: NO
Relay Settings			
XIV.	<b>Setting (I&gt;)</b>	: I> Settings	5% – 250% in steps of 1%.
		: I> Time Multiplier (TMS)	x0.01 – x1.00 in steps of 0.01
		: I> Curve (Operating Time)	C1 – C6 ( IDMT curve C1 – C5 or Define Time C6 )
		: I> C6 Delay	0 – 100.00 Sec in steps of 0.02Sec.
		: I>> Settings	00% – 2000% in steps of 10% 00 means block
		: I>> Delay	0 – 2.00 Sec in steps of 0.01Sec.
Operational Indicators (Flags) 4 user assignable bicolour output LED Default assignment			
XV.	LED1 - PROT.H /ON	: Green LED indicates Relay OK (Protection Healthy) : Red LED indicates Fault in following conditions. 1. Problem in relay Hardware. 2. Trip Circuit Fault	
	LED 2 - PICK-UP	: Red LED indicate Start of timer Self Reset (SR) Type	
	LED 3 - FAULT	: Red LED indicate Relay Operated Flag (HR)	
	LED 4 - TRIP	: Red LED indicates Output TRIP relay contact closer (SR) Type
